Computer science as an academic discipline began in the 1960s. Emphasis was on programming languages, compilers, operating systems, and the mathematical theory that supported these areas. Courses in theoretical computer science covered finite automata, regular expressions, context free languages, and computability. In the 1970s, the study of

DATA SCIENCE FOUNDATIONS

While traditional areas of computer science remain highly important, increasingly researchers of the future will be involved with using computers to understand and extract usable information from massive data arising in applications, not just how to make computers useful on specific well-defined problems. With this in mind we have written this 9

Data Science: Exploring the Mathematical Foundations

Paraphrasing this to data science: "Everybody wants to have software provide them insights from data, but no one wants to learn any math." The top two comments here illustrate this perfectly. Anyone who is serious about learning data science will read this book and will not shy away from learning math.
