Developments in Soil Science | Digital Soil Mapping - An

Pedogenesis (soil formation) is a complex process that does not follow a linear path of development. While some soils do form in place, most soils form in mineral or organic substrates (parent materials) that have been displaced from their source of origin. Let's talk about some key factors regarding weathering and soil formation.

Series: Developments in Soil Science. The Developments in Soil Science series has been designed to provide a comprehensive source of theoretical and practical reference books for scientists working in the broad field of soil science. Topics include Synchrotron-based Techniques in Soils and Sediments, Geomorphometry, Soil Quality and ...

Book Series: Developments in Soil Science - Elsevier

Once the soil loses its gravitational water downward (usually in minutes to hours), water that is held up the soil against leaching is bound there by matric forces which range from 0.1 to 0.3 bars in the thicker portions of water films extending into macropores. The soil is now at field capacity.

Basic Soil Science - Virginia Department of Conservation

One of the central tenets in soil science is that all properties of a given soil are determined by five state factors, the soil forming factors (Dokuchaev, 1898 cited by Jenny, 1980): parent material, topography, climate, biota (including man), and time.
