The development of mechanical and bioprosthetic valvular prostheses have enhanced the survival and quality of life for countless patients. Despite the benefits provided by prosthetic valves, there are still significant limitations to those currently available. The goal biological valve tissue engineering strives to

3 Fieldbus Interface for High Performance Proportional Valves The analogue interface of a proportional valve is easy to handle, and it does not affect the performance of a valve, if an adequate wiring is carried out. However, the time discrete transmission of demand values in a fieldbus system can affect the closed loop performance.

A valve is a mechanical device that controls the flow of fluid and pressure within a system or process. A valve controls system or process fluid flow and pressure by performing any of the following functions: Stopping and starting fluid flow Varying (throttling) the amount of fluid flow Controlling the direction of fluid flow

GTâ€™s dash valves are custom designed valves for remote actuation of air-powered accessories, in a variety of styles and markings. They have been engineered for functionality and durability, as well as for a pleasing appearance. Options include indicator lights, and secondary inlet ports for daisy chaining of multiple valves.

In this work, problem presented is of modifying the existing plug and seat arrangement of the globe valve, such that it should control the flow of fluid up to maximum permissible lift ranging from 2mm to 16mm to obtain the optimum range of fluid flow. The current plug and seat arrangement of globe valve is according to quick
