Ore Deposit Models, Vol. 2 - lepmida.com

USGS Mineral Deposit Models are "an organized arrangement of information describing the essential characteristics or properties of a class of mineral deposits. Models themselves can be classified according to their essential attributes (for example: descriptive, grade-tonnage models, genetic ...

species. This has led to a self-consistent geochemical exploration model for deposits in the Cobar Basin. The model predominantly deals with the dispersion of lead, copper and zinc from weathering base metal orebodies, but other elements are also considered. The model promises to be very useful for exploration in highly weathered terrains, particularly where the deposits lack significant surface expression.

model. Similarly, the formulation of genetic models relies upon an understanding of the physics and chemistry of ore-forming processes. The development of mineral deposit models is therefore an iterative process. Kambalda-type nickel sulfide deposits provide a useful illustration of the relationship among the three kinds of deposit models.

MINERAL DEPOSIT MODELS: NICKEL SULFIDE DEPOSITS OF THE

Detailed descriptions of 3D models of actual deposits are rare in the public domain. In the absence of such models, authors use cartoons, schematic diagrams, and cross-sections of deposits. It is these simplistic diagrams that establish the geometric image of "ore deposit" models in most geologists' minds.

deposit types include Carlin, low-sulfidation epithermal, Au-rich VMS and Witwatersrand deposits. The key geology features of the ore-forming environments and the key geologic manifestations of the different deposit types form the footprints of ore systems that are targeted in exploration programs.
