The intrinsic property of cell-penetrating peptides (CPPs) to deliver therapeutic molecules (nucleic acids, drugs, imaging agents) to cells and tissues in a nontoxic manner has indicated that they may be potential components of future drugs and disease diagnostic agents.

Among all peptides, cyclic [HR]4 peptide was able to improve the delivery of a cell impermeable fluorescence-labeled phosphopeptide by two-fold. Fatty acids of different alkyl chain length were attached at the N-terminal of the linear peptide (HR)4 to improve the molecular transporter property.

Cell-Penetrating Peptides: Design, Synthesis, and Applications

β -sheet formation is a final consideration in peptide design. During synthesis, β -sheet formation causes incomplete solvation of the growing peptide and results in a high degree of deletion sequences in the final product.

The first peptide synthesis, as well as the creation of the term "peptide," was reported by Fischer and Fourneau (Fischer and Fourneau, 1901). Bergmann and Zervas created the first reversible N⁺-protecting group for peptide synthesis, the carbobenzyoxy (Cbz) group (Bergmann and Zervas, 1932).

Introduction to Peptide Synthesis

The design and synthesis of peptidomimetics are most important because of the dominant position peptide and protein-protein interactions play in molecular recognition and signaling, especially in living systems.

Peptidomimetics, a synthetic tool of drug discovery

At the Proteomics and Peptide Synthesis Core, we work with each investigator to form an individual plan for project goals and emphasize customization of the experimental design that matches any budget.
