form of radio waves. Radio waves travel at the speed of light in free space, 186,000 miles per second, or 300,000,000 meters per second. Free space implies that radio waves travel through empty space or a vacuum. In actual practice, radio energy travels slightly slower because of the presence of trees, hills, lakes, and the air it travels through.

RADIO WAVE PROPAGATION AND ANTENNAS

Radio Waves Propagation Radio propagation is a term used to explain how radio waves behave when they are transmitted, or are propagated from one point on the Earth to another. In free space, all electromagnetic waves (radio, light, X-rays, etc) obey the inverse-square law which states

wavelength of radio wave. ∅ A radio wave that meets an obstacle has a natural tendency to bend around the obstacle. The bending, called diffraction, results in a change of direction of part of the wave energy from the normal line-of-sight path. This change makes it possible to receive energy around the edges of an obstacle.
